## Six Key Cybersecurity Engineering Activities for Building a Cybersecurity Strategy

February 3, 2021 — A new [blog post](#) by the SEI's Carol Woody and Rita Creel describes how cybersecurity engineering can help build an organization's cybersecurity strategy. Today's integrated, complex technology operates in a dynamic, contested environment in which operational security controls are no longer sufficient to protect missions.

Woody and Creel, of the SEI's CERT Division, write in the post, "Cybersecurity engineering applies the rigor of engineering with the knowledge of operational security into all aspects of the lifecycle to build, configure, operate, and maintain systems for secure and resilient operation." They discuss how six important areas of cybersecurity engineering enhance a cybersecurity strategy:

- determining risk
- defining and monitoring system and component interactions

- evaluating trusted dependencies
- anticipating and planning responses to attacks
- coordinating security throughout the lifecycle
- measuring to improve cybersecurity

Woody and Creel's blog post, *Six Key Cybersecurity Engineering Activities for Building a Cybersecurity Strategy*, augments their November 2020 webcast, [What Is Cybersecurity Engineering and Why Do I Need It?](#) A forthcoming podcast will feature the two experts further discussing cybersecurity engineering.
