# Data Sharing: Lessons learned by the CERT/CC and the CERT/NetSA groups

Roman Danyliw <rdd@cert.org>

FloCon 2004: Data Sharing Panel

CERT® Network Situational Awareness Group  
Software Engineering Institute  
Carnegie Mellon University  
Pittsburgh, PA 15213-3890

*The CERT Network Situational Awareness Group is part of the Software Engineering Institute. The Software Engineering Institute is sponsored by the U.S. Department of Defense.*

## Background

---

- CERT/CC has a long history of accepting incident reports, artifacts, and vulnerability information
  - Synthesizing this input into public analysis such as advisories and the coordination of patch releases
- CERT/SA has experience in analyzing operational data-sets of other organizations
  - Synthesizing these data-sets to form situational awareness, and new analytical approaches

## Decomposing “Data Sharing”

---

- Data collection
  - Accepting data from outside your organization
- Data dissemination
  - Providing value-add back to data sources or constituency

*An organization only involved in data collection  
is not “data sharing”*

## Concerns in Sharing

---

- Concerns for the data source
  - Is anything “sensitive” being released?
    - If so, what assurances do I have about my data?
  - Is there sufficient benefit to me in providing this information?
- Concerns for the data recipient
  - Is there any risk in accepting this information?
    - Does the data source know it is a data source?
    - Can others know that this data source is being used?
    - What responsibilities do I have with respect to handling/sharing this information with others?
  - Is there sufficient benefit to collecting this information?

# Steps in the Sharing Process

---

## (1) I am reporting data to CERT

---

- Sharing data is technologically hard and requires human intervention
  - Few tools provide native support for sharing
  - CERT does provide tools to extract, filter, and sanitize information
- What guarantees do I have for my data?
  - Once data is handed over, all guarantees are founded on trust – no practical technological solution
  - Accreditation of processes, technology, and facilities

## (1) I am reporting data to CERT (cont'd)

---

- “My information is sensitive, I want to protect:”
  - Information revealed in packet payloads
    - Contents of email, clear-text authentication
  - Internal topology of the network
    - Size and the purpose of individual hosts
  - Laxness or lapses in security
    - Outbound attacks
    - Usage of certain services (e.g., P2P)
    - Indications of vulnerabilities
- Often raw data is not possible; only share summaries

## (2) CERT is receiving my information

---

- Willingness to share does not always mean utility for the CERT
  - Impossible to mechanically parse free-form text reports
  - Organizational or obscure data formats (i.e., vendor X with tool Y version Z.zzz.z)
- Employ standard data use policies
  - For all automated data sharing, a formal MOU governs the exchange
  - Public, default data disclosure policy for all self-reported data
- Public knowledge of honey-pot addresses is problematic

## (2) CERT is receiving my information

---

- Community specific constraints
  - Academic community
    - Cannot tie data back to students
      - IP address resolved to host names which contained a student's name
  - Federal community
    - Cannot collect Personally Identifiable Information (PII)
      - Only present in the payload
  - Medical community
    - HIPPA prevents PII collection
      - Only present in the payload

## (3) CERT is disseminating information

---

- Does not provide attribution
  - Sometimes obfuscates results to do peer comparison
- Coordinating pre-release information requires a substantial volume of encrypted email
  - Dedicated tool (srmil) to handle encryption/decryption among various standards (e.g., gpg, pgp, s/mime)
- How to control the use of data after it is made available?
  - Contractors and federal government “rights to use” on pre-release information
  - Data leak through a 3<sup>rd</sup> party
  - Reaction of some open-source vs. COTS vendors to a vulnerability

## (3) CERT is disseminating information

---

- Who is the right audience?
  - Traditionally, advisories were for system administrators – now have summaries for management
  - How to reach home users?

## (4) I am receiving CERT information

---

- Optimal format for receiving information:
  - Semantics: push vs. pull
  - Transport protocol: email, web, etc.
  - Machine parsable vs. human readable
- How timely is the information?
  - Incomplete information, but early notification
    - Incremental updates
  - Complete information, but late notification

## Observations in Data Sharing

---

- Datasets based on more sites is not always better – a representative sample is key
  - *Defining representative is hard*
- The community needs to develop and adopt standards formats and protocols to exchange analytical results
  - *Adoption by the vendor community will be required*
- Centralization is not desirable; expertise to analyze data is rarely found in one place – build a community of analysts
  - *The politics of data sharing make this hard*
