

IP Flow Information eXport (IPFIX)

elisa.boschi@hitachi-eu.com

{boschi, zseby, mark, hirsch}@fokus.fraunhofer.de

Outline

- IPFIX
- Terminology
- Applicability
- Initial Goals
- Current Status
 - *Rough consensus (Internet-Drafts and RFCs)*
 - *Running code (Implementations)*
- Conclusions

IP Flow Information eXport

- General data transport protocol
- Flexible flow key (selection)
- Flexible flow export - **TEMPLATE BASED**
 - New fields can be added to flow records without changing the structure of the record format
 - The collector can always interpret flow records
 - external data format description → compact encoding
- Efficient data representation
 - Extensible (future attributes to be added)
 - Flexible (customisable)
 - Independent (of the Transport protocol)

Terminology

- A TEMPLATE is an ordered sequence of **<type,length>** pairs
 - specify the structure and semantics of a particular set of information (Information Elements)
- DATA RECORDS contain values of parameters specified in a template record
- OPTION RECORDS define the
 - structure and interpretation of a data record
 - how to scope the applicability

The protocol

- Unidirectional (push mode)
- The exporter sends data (and option) templates
 - Information Elements descriptions
- Information Elements are sent in network byte order

Applicability

- Target applications requiring flow-based IP traffic measurements (RFC 3917)
 - Usage-based accounting
 - Traffic profiling
 - Attack/intrusion detection
 - QoS monitoring
 - Traffic engineering
- Other applications (AS):
 - Network planning
 - Peering agreements

Attack / intrusion detection

- IPFIX provides input to attack / intrusion detection functions:
 - Unusually high loads
 - Number of flows
 - Number of packets of a specific type
 - Flow volume
 - Source and destination address
 - Start time of flows
 - **TCP flags**
 - Application ports

Initial Goals 1/4

- *Define the notion of a "standard IP flow"*

*A **Flow** is a set of IP packets passing an Observation Point in the network during a certain time interval. All packets belonging to a particular flow have a set of common properties defined as the result of applying a function to the values of:*

- One or more packet header field (e.g. dest. IP address), transport header field (e.g. dest. port number), or application header field (e.g. RTP header fields RTP-HDRF)*
- One or more characteristics of the packet itself (e.g. # of MPLS labels)*
- One or more fields derived from packet treatment (e.g. next hop IP address)*

Initial Goals 2/4

- *Devise data encodings that support analysis of IPv4 and IPv6 unicast and multicast flows...*
 - **IPFIX Information Model**
 - formal description of IPFIX information elements (fields), their name, type and additional semantic information
- *Consider the notion of IP flow information export based upon packet sampling*
 - The flow definition includes packets selected by a sampling mechanism
 - Through option templates, the configuration sampling parameters can be reported

Initial Goals 3/4

- *Identify and address any security concerns affecting flow data.*
 - Disclosure of flow info data
 - Confidentiality → IPsec and TLS
 - Forgery of flow records
 - Authentication and integrity → IPsec and TLS
- *Specify the transport mapping for carrying IP flow information → SCTP / SCTP-PR*
 - Reliable (or partially reliable)
 - Congestion aware
 - Simpler state machine than TCP

Initial Goals 4/4

- *Ensure that the flow export system is reliable (minimize the likelihood of flow data being lost and to accurately report such loss if it occurs).*
 - SCTP, TCP
 - UDP
 - Templates are resent at a regular time interval
 - Sequence numbers

Current status

- **Internet-Drafts (~ sent to the IESG):**
 - Architecture for IP Flow Information Export
 - Information Model for IP Flow Information Export
 - IPFIX Protocol Specification
 - IPFIX Applicability
- **Request For Comments:**
 - Requirements for IP Flow Information Export (RFC 3917)
 - Evaluation of Candidate Protocols for IP Flow Information Export (IPFIX) (RFC 3955)

Other related drafts

- **Export of per packet information with IPFIX**
 - E.Boschi, L.Mark draft-boschi-export-perpktinfo-00.txt
- **IPFIX aggregation**
 - F.Dressler, C.Sommer, G.Munz draft-dressler-ipfix-aggregation-01.txt
- **Simple IPFIX Files for Persistent Storage**
 - B.Trammell draft-trammell-ipfix-file-00.txt
- **IPFIX templates for common ISP usage**
 - E.Stephan, E. Moureau draft-stephan-isp-templates-00.txt
- **IPFIX Protocol Specifications for Billing**
 - B.Claise, P.Aitken, R.Stewart draft-bclaise-ipfix-reliability-00.txt
- **IPFIX Implementation Guidelines**

„Running code“

- At least 6 different IPFIX implementations
 - Ours is open source: <http://www.6qm.org/downloads.php>
- Implementers mailing list
- Interoperability events
 - July 2005, Paris (<http://www.ist-mome.org>)
 - Further tests planned
- Implementation guidelines in preparation

Conclusions

- IPFIX is the upcoming standard for (IP) flow information export
- Allows common analysis tools
- Data exchange

... questions?

IPFIX message format

- IPFIX message
 - message header
 - 1 or more {template, option template, data} sets
- A TEMPLATE is an ordered sequence of <type, length> pairs used to completely specify the structure and semantics of a particular set of information
 - (unique by means of a template ID)
 - DATA RECORDS contain values of parameters specified in a template record
 - Field values are encoded according to their data type specified in IPFIX-INFO
 - OPTION RECORDS define the structure and interpretation of a data record including how to scope the applicability

INFORMATION ELEMENTS

- INFORMATION ELEMENTS are descriptions of attributes which may appear in an IPFIX record
 - IANA assigned
 - Defined in the Information Model
 - Enterprise specific (proprietary I.E.)
- Variable Length I.E.
 - The length is carried in the information element content itself
- The type associated with an IE
 - indicates constraints on what it may contains
 - determines the valid encoding mechanisms for use in IPFIX
- I.E.s must be sent in network byte order (big endian)

INFORMATION ELEMENTS

- The elements are grouped into 9 groups according to their semantics and their applicability:
 1. Identifiers
 2. Metering and Exporting Process Properties
 3. IP Header Fields
 4. Transport Header Fields
 5. Sub-IP Header Fields
 6. Derived Packet Properties
 7. Min/Max Flow Properties
 8. Flow Time Stamps
 9. Per-Flow Counters
 10. Miscellaneous Flow Properties
- } can serve as Flow Keys
(used for mapping packets to Flows)

Requirements for the data model

- IPFIX is intended to be deployed in high speed routers and to be used for exporting at high flow rates
- → Efficiency of data representation
- How data is represented = data model
- **EXTENSIBLE**
 - For future attributes to be added
- **FLEXIBLE**
 - Concerning the attributes (customisable)
- **INDEPENDENT**
 - Of the transport protocol
