Acquisition Dynamics

The Evolution of a Science Project

9. Warfighters wait years for a new system to be built from scratch.

8. New versions of the system can't be deployed with needed capability, robustness, and performance.

7. New program office unwilling to discard prototype code due to field deployment pressures.

6. Project infrastructure, processes, & staff not able to scale up to production development.

5. As system grows, poor architecture, documentation, & code quality cause poor reliability, performance, & usability.

3. Warfighters and field commanders demand more capability, broader deployment, faster response.

2. Prototype is deployed on small scale, and is well received.

1. Project begins as small informal effort to build prototype & prove concept.

4. Project staff is diverted to field support, so development progress slows.

This scenario aggregates five SEI software-reliant system acquisition ITAs conducted in 2006-2009.

Basis for Modeling: Independent Technical Assessments

ITA: Detailed examination of challenged programs with interviews, document reviews, and code analysis

“What they did at first was a proof of concept, a quick and dirty prototype, and when they tried to scale it up, there were indications that it might not be possible...”

Key Preliminary Findings

The Evolution of a Science Project Assumption

Applying pressure to workers developing SP results in undiscovered rework

SP Rework to be Discovered (Applying Pressure to Workers)

The Evolution of a Science Project

Key Preliminary Findings -1

High pressure, or moderate pressure for long periods, can lead to a “tipping point”

PD Discovered Quality Issues (Applying Pressure to Workers)

The Evolution of a Science Project

The Tipping Point in Evolution of a Science Project

- Accumulating rework creates a dangerous feedback dynamic
- “Firefighting” due to rework is a key underlying element
- Key drivers in reaching the “tipping point” are:
 - a) pressure on developers
 - b) emphasis on schedule and features vs. quality
 - c) timing of the transition from science project to production development
 - d) degree of “ripple effect”

The Evolution of a Science Project

Key Preliminary Findings -2

Placing modest pressure on developers for limited periods shortens schedule

- VenSim optimization shows that placing pressure at a low level is optimal with respect to reducing project duration
- By allowing periods of pressure, followed by periods of relaxation, the program might:
 - Limit worker burnout
 - Perform better regarding schedule

The Evolution of a Science Project

Key Preliminary Findings -3

The tipping point contributes to the “90% Done” Syndrome

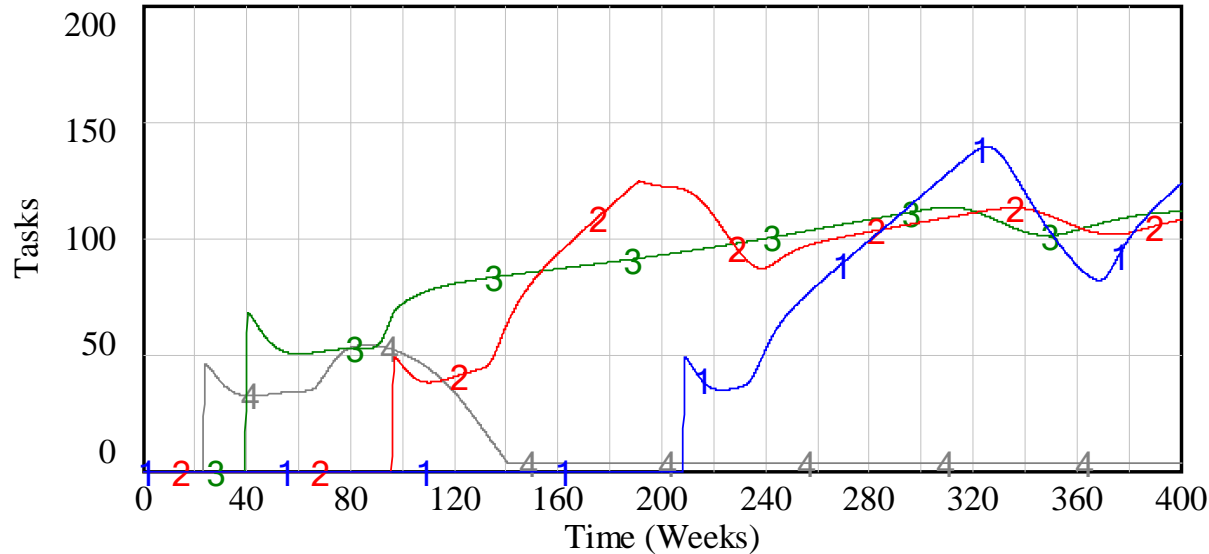

The Evolution of a Science Project

Key Preliminary Findings -4

The transition from science project to production effort should be made *early*

- A late transition increases the amount of undiscovered rework that is transferred

PD Discovered Quality Issues (Scoping the SP Effort)

The Evolution of a Science Project

Key Preliminary Findings -5

Throwing away the prototype results in better program performance

- However, very early transition or evolutionary development may also be viable

Preliminary Conclusions

Many acquisition program behaviors are an interaction of the inherent structural dynamics, inc. the incentives that act on key participants.

Tipping points may play a key role in many challenging software development and acquisition situations.

System dynamics modeling can provide a deep understanding of poorly understood dynamics in software-reliant acquisition.

Models are a great source for generating research questions!

Future work:

- Calibrating model based on acquisition program assessments conducted at SEI and data obtained from programs.
- Identifying and evaluating potential mitigations
- Develop games to teach model-based lessons learned

Summary and Conclusions

Joint Program Acquisition Experience Wanted!

We are analyzing the dynamic organizational behavior of joint and joint-interest programs as part of an ongoing research project.

We are conducting group modeling workshops to elicit key joint program behaviors, and are using the information to build a system dynamics model.

If you'd be interested in participating in a workshop, or collaborating with us in other ways, please contact:
