Agenda

1. Introduction
2. SEMPR data and analysis
3. Conclusion

Agenda

1. Introduction
2. SEMPR data analysis
3. Conclusion

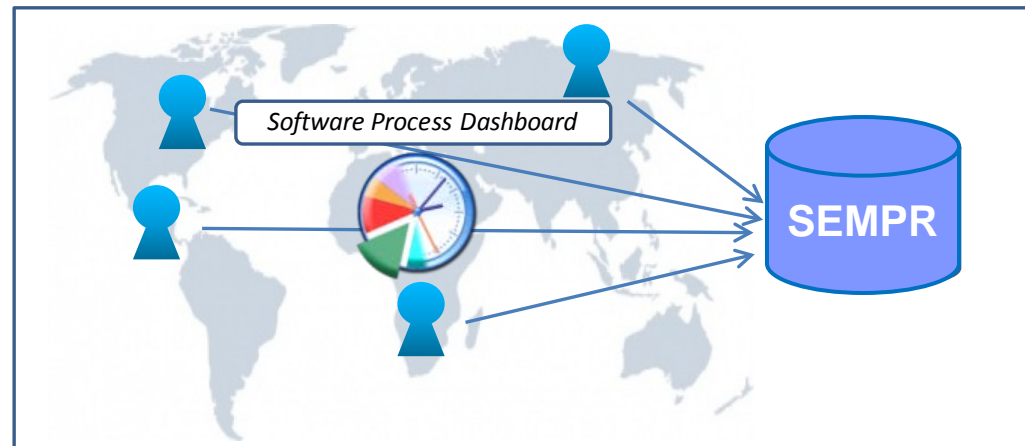

Purpose of this presentation

- This presentation tells...
- Project overview in SEMPR
- Benchmark planning parameters in SEMPR
- Benchmark project level performance and work item (component) level performance

About SEMPR

- Software Engineering Measured and Performance Repository
- SEI has collected data from organizations that have adopted TSP in SEMPR
- Stores project data in Tuma Solutions Team Process Data Warehouse
 - From 109 project cycles (in this report)
 - Used the Software Process Dashboard

How did we measure data quality in SEMPR

- Time log and defect log have high correctness and consistency by automatic data recording.
- Size log and task log have low correctness by manual data recording.

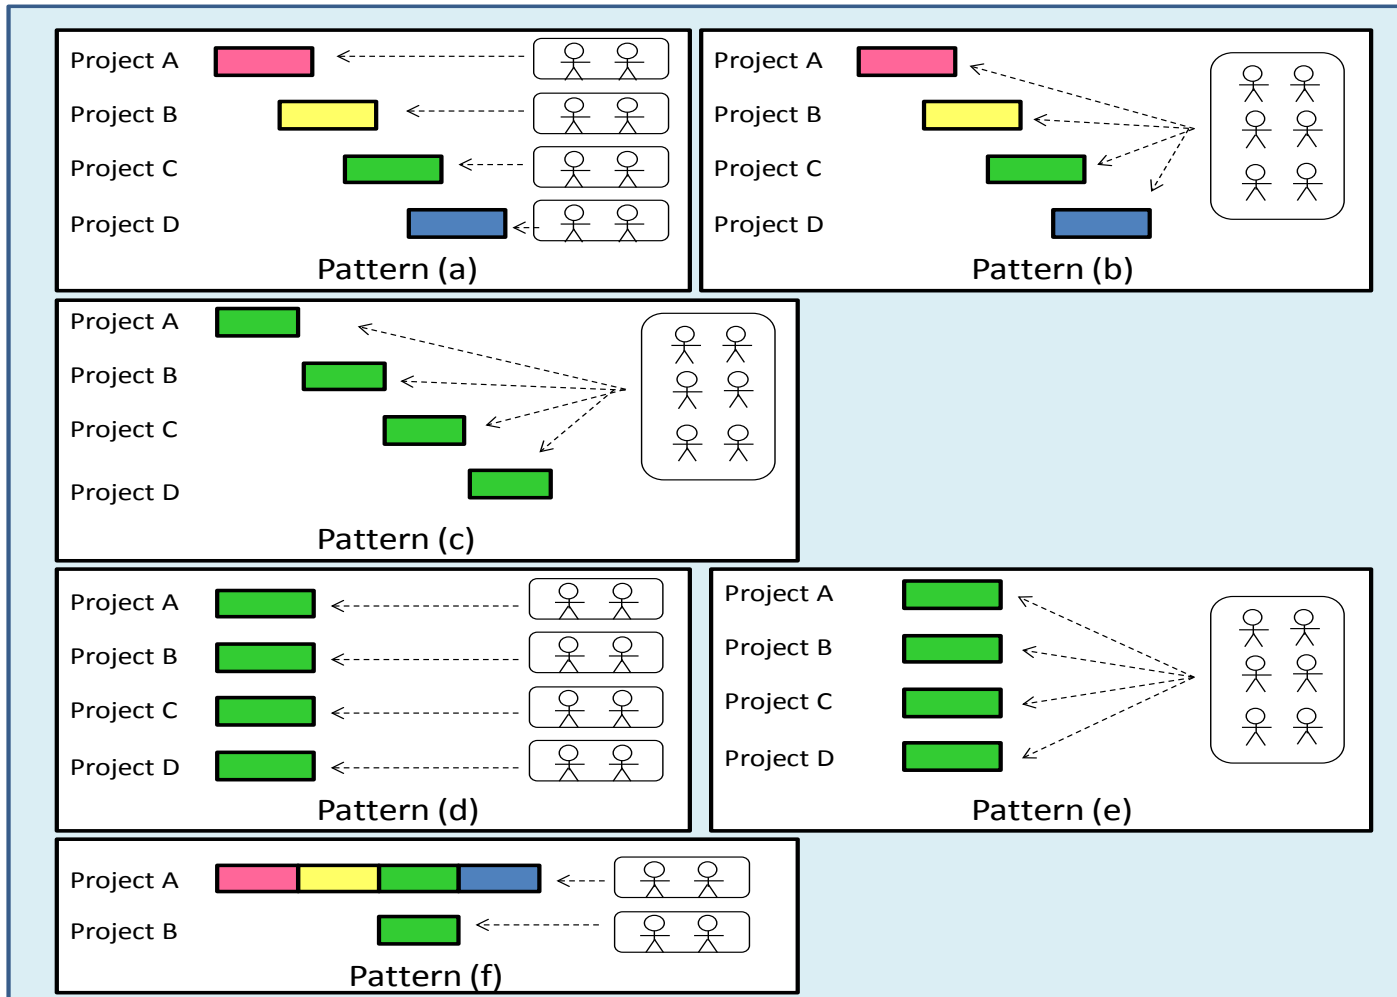

What do the data tell us?

1. Introduction
2. SEMPR data analysis
3. Conclusion

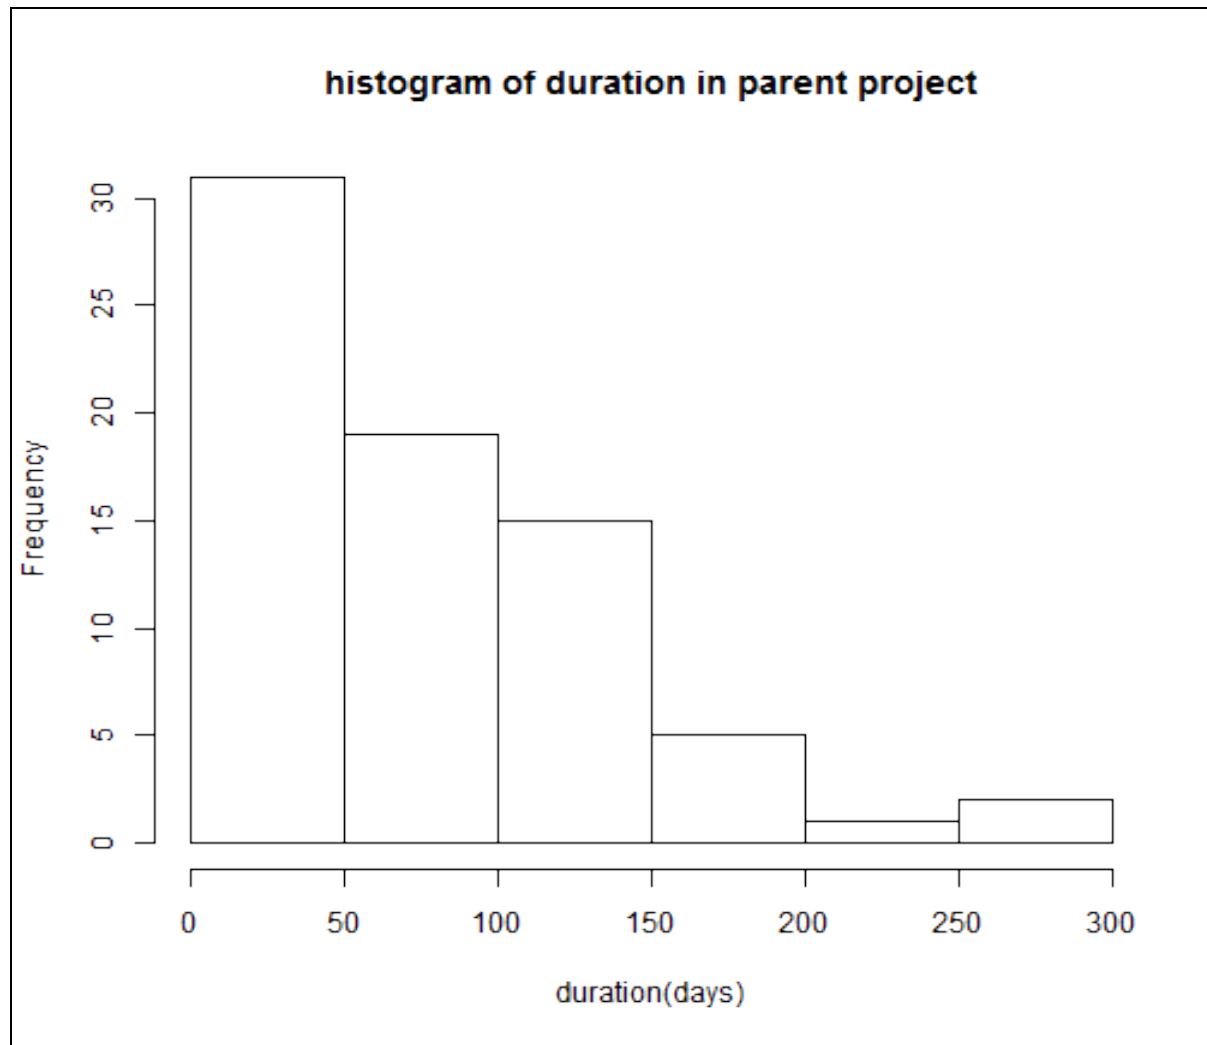

How are projects organized?

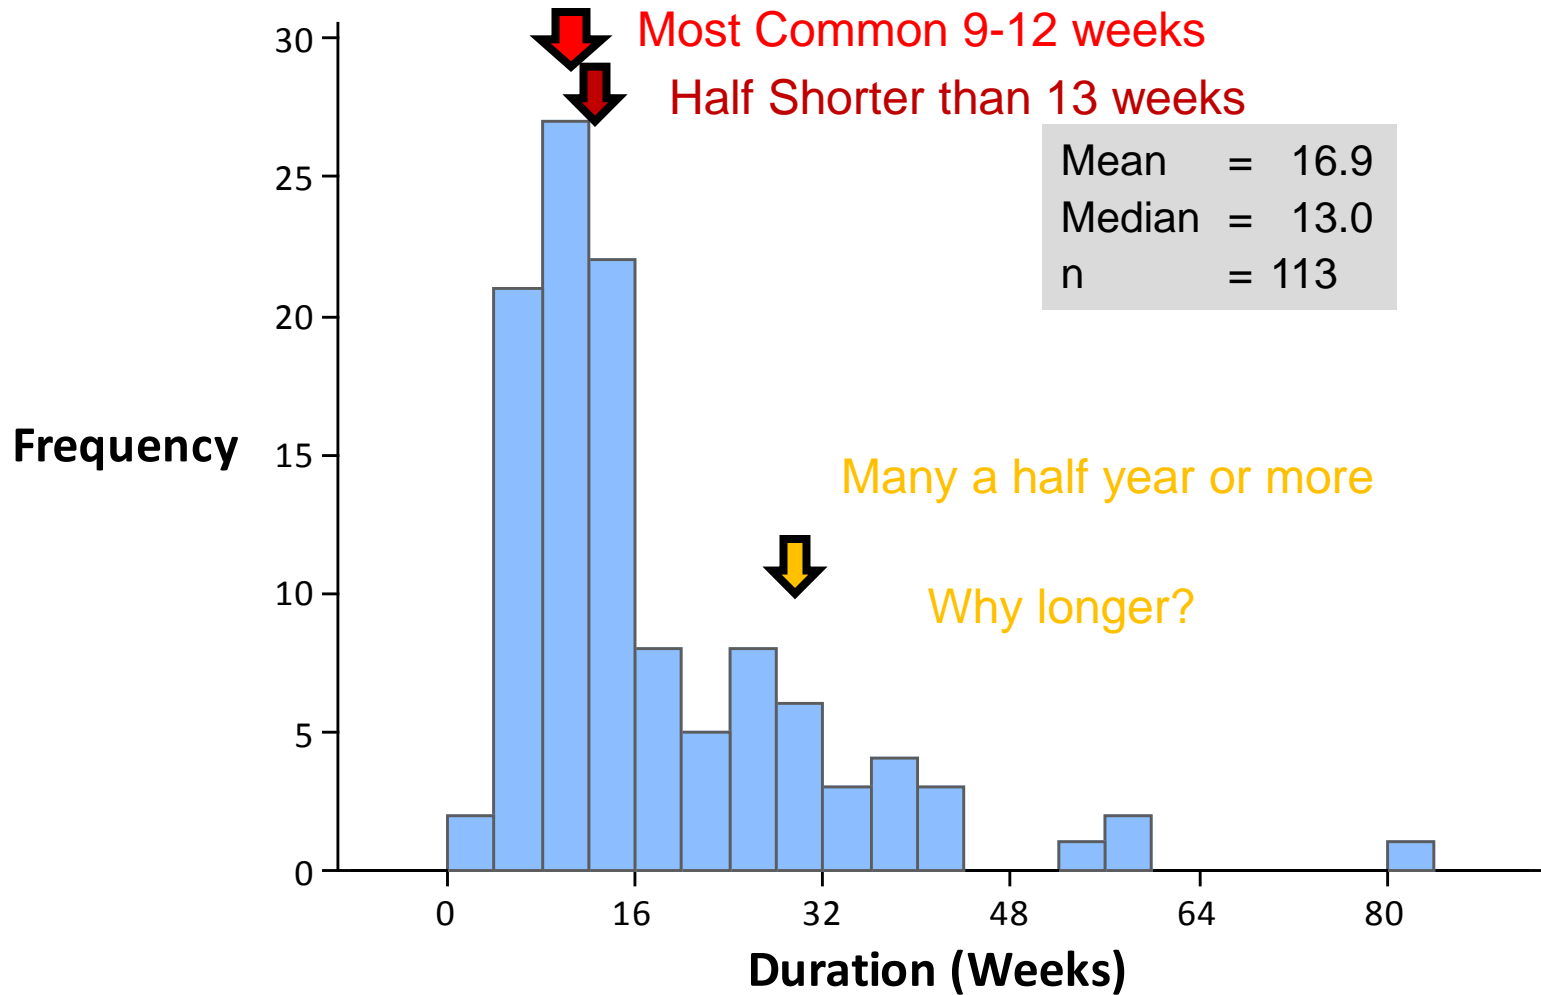

How many projects are found in each pattern?

What were the project durations?

What are the planning period durations?

How many team members on projects?

How many task hours per week?

mean Team Member Weekly Direct Hours per Week

How do Plan and Actual planned project hours compare?

the scatterplot: Plan task hours vs. Actual task hours in project

Project level time hours data is high predictable.

the scatterplot: Log plan task hours vs. Log actual task hours in project

How do Plan and Actual component hours compare? (work item)

the scatterplot: Plan task hours vs. Actual task hours
in component

Log transformed work item level
time hours data is predictable.

the scatterplot: Log plan task hours vs. Log actual task hours
in component

How did they perform to planned schedule?

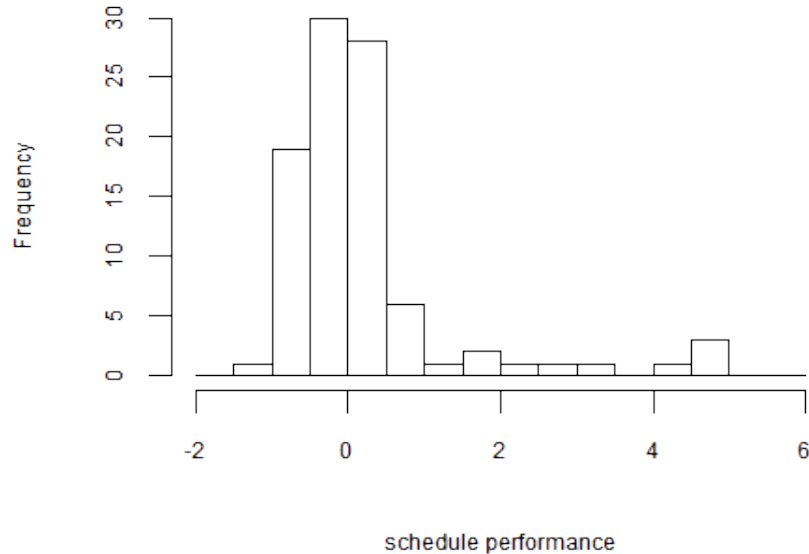

schedule performance =

$$\frac{\text{actual duration} - \text{plan duration}}{\text{plan duration}}$$

plan duration

Project performance

histogram of schedule performance in all projects
overflow bin = 5

Work item performance

histogram of schedule performance in all work items
overflow bin = 2

How well did they estimate effort?

effort performance =

$\frac{\text{actual effort} - \text{plan effort}}{\text{plan effort}}$

Project performance

histogram of effort performance in all projects

Work item performance

histogram of effort performance in all work items
overflow bin = 2

How fast are defects injected? (all work items)

What were the defect removal rates? (all work items)

How did defect injection rates differ by phase

All phase

boxplot of defect injection rate in all work items

DIR in code review has wide range and highest median.

Except code phase

boxplot of defect injection rate in all work items

How did defect removal rates differ by phase

All phase

boxplot of defect removal rate in all work items

DRR in Compile and DRR in code review are higher than DRR in unit testing.

Except compile phase

boxplot of defect removal rate in all work items

What were the total defect densities

Agenda

1. Introduction
2. SEMPR data analysis
3. Conclusion

Conclusion

SEMPR collects TSP project data for benchmark and analysis

Projects organize in many ways

Benchmarks include

- distributions for defect injection and removal rates
- Ranges of task hours
- Effort estimation accuracy
- Schedule estimation accuracy

Much work remains

- Include more contextual data
- Continue to add projects the database

Acknowledgement

We thank David Tuma of Tuma Solutions for contributing the process dashboard warehouse software.
