Agenda

What Is the Domain?

Who Are the Principal Stakeholders?

What Was the Problem?

How Did JFSP Approach the Solution?

What Changed in the Strategic Environment?

Was the Problem Resolved?

What Can Other Agencies Learn?

Wildland Fire Fuels Treatment

Increasingly intense fire seasons and changes in the natural and man-made environment all increase the hazard that fires pose to communities, watersheds, and ecosystems

Fuel Managers plan and execute fuel treatments to proactively mitigate threats to firefighters & communities and to maintain/restore ecosystems; example treatments include:

Mechanized: Large equipment treatments such as thinning, pruning, lop and scatter, mowing, crushing, chipping, etc.

Prescribed Fires: A planned fire purposefully ignited (under pre-determined conditions) to reduce fuel and/or improve habitat

Wildland Fire: Managing naturally occurring fires (such as lightning ignitions) for resource benefits

Other: Chemical, biological, manual

The Wildland Fire Community

The federal **wildland fire community** (*the users as well as the researchers/developers of the tools*) consists of six agencies

- Agriculture (Forest Service)
- Interior (National Park Service, Fish & Wildlife Service, Geological Survey, Bureau of Land Management, Bureau of Indian Affairs)

The **Joint Fire Science Program** (*the program manager*) funds wildland fire management research and distributes results to policy makers, managers and practitioners to improve wildland fire management decision making

The Wildland Fire Management **Research, Development & Application** (RD&A) (*the follow-on transition agent*) is the liaison between research, planning & operations, and interagency IT as well as advises programs at the local, regional, & national levels

The Wildland Fire Community (Early 2000's)

New Tools & Significant Capability Growth – But Also:

- *Confusion*: many fragmented and overlapping applications
- *Inefficiency*: many interfaces, time-consuming data transformations
- *High costs*: stove-piped, unconnected software development and maintenance practices
- *“Best” models*: lack of performance and comparison data

In the Fuels Treatment Community in particular:

- Inconsistent use of tools and analyses
- Fragmented guidance for model selection
- No risk assessment tools for non-experts
- No collaboration tools
- Tool-based training did not address the end-to-end problem

Holistic Approach Involving Four Key Stakeholder Groups

Software Tool and Systems (STS) Study

In 2007, JFSP in coordination with the *National Wildfire Coordinating Group (NWCG) Fuels Management Committee* initiated the Software Tools & Systems (STS) study

- **Phase I** (2007-08) studied the problem of “software chaos” that had been identified by the fire and fuels user community
- **Phase II** (2008-09) designed a collaborative system architecture and software lifecycle processes
- **Phase III** (2009-10) focused on proof-of-concept demonstrations of the *Interagency Fuels Treatment Decision Support System (IFTDSS)*
- **Phase IV** (2010-12) focused on gathering user feedback from a large body of test users on IFTDSS’s growing functionality
- **Phase V** (2012-13) was a comprehensive IFTDSS assessment

The SEI performed the Phase I Study and the Phase V Assessment

Software Tool and Systems (STS) Study

JFSP's Implementation of the Phase I Recommendations

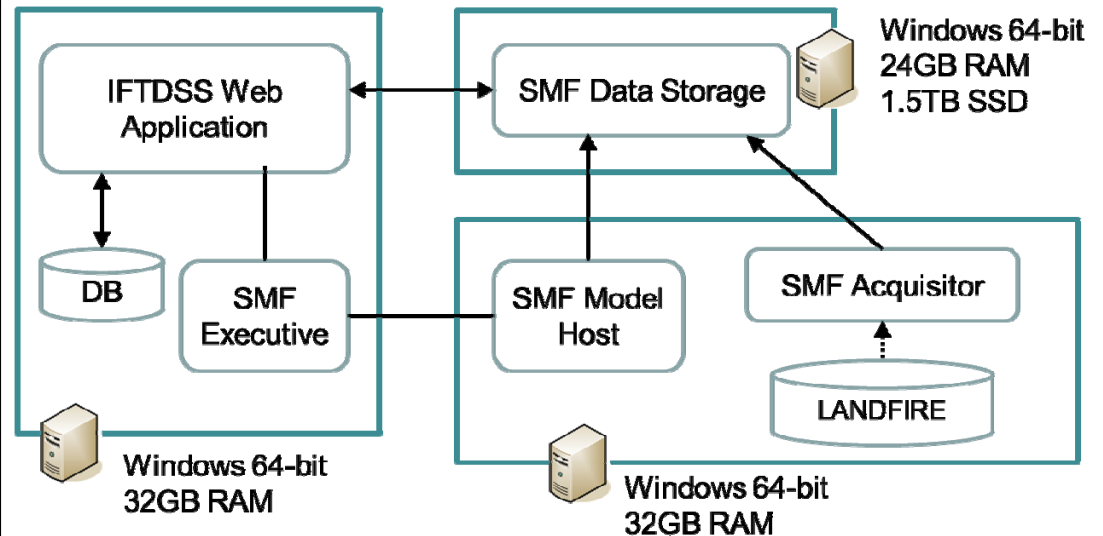

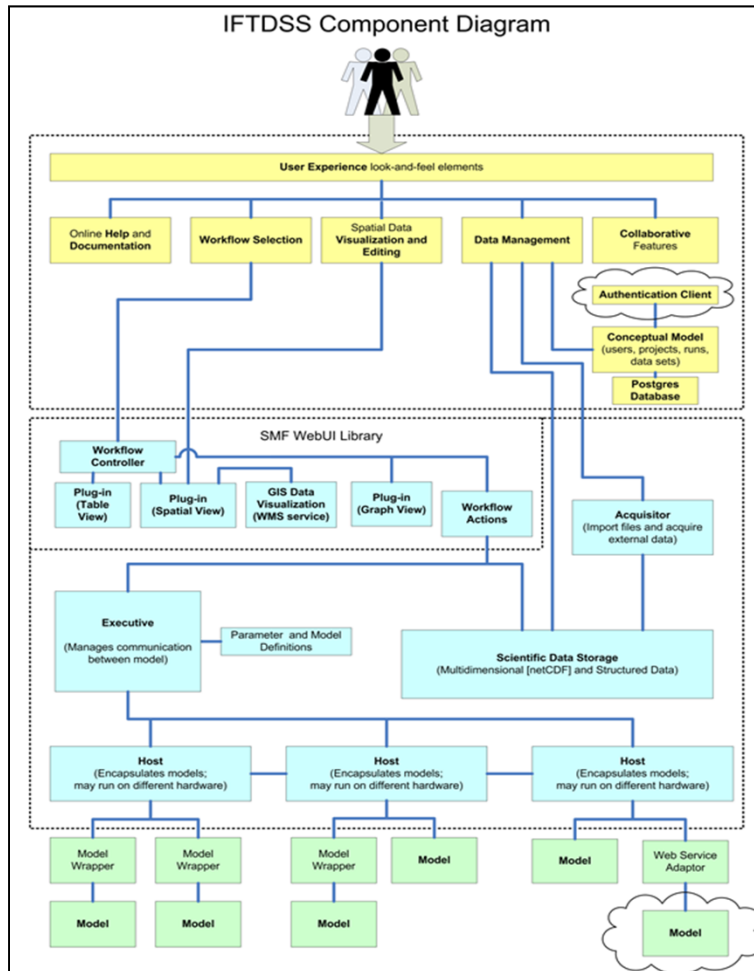

- Adopt centrally managed service integration frameworks
 - Separate models and data from interfaces
 - Consolidated, web-based interfaces
- Align business practices with service integration frameworks
 - Users, model developers, governance, IT
 - Lifecycle management, portfolio management
 - Analysis, performance measures, training, collaboration support

JFSP's Objectives for Phases II, III, and IV

- Demonstrate a service integration framework
 - Fuels treatment (workflows, risk assessments) and lifecycle management (realign lifecycle responsibilities)
- Future capabilities
 - System of record as well as process to deploy tools from research

IFTDSS (High Level)

Changes in the Strategic Environment

In 2008, USDA & DOI released the *Interagency Prescribed Fire Planning and Implementation Procedures Guide* (the *2008 Prescribed Fire Guide*)

In 2009, Congress passed *The Federal Land Assistance, Management, and Enhancement Act* (The FLAME Act)

In 2011, the Wildland Fire Leadership Council (WFLC) completed:

- *A National Cohesive Wildland Fire Management Strategy*
- *The Federal Land Assistance, Management and Enhancement Act of 2009 Report to Congress*

In 2012, the Department of the Interior and the USDA Forest Service signed the *Wildland Fire Information and Technology (WFI&T) Plan*

Phase V: IFTDSS Evaluation Study

Requested by senior leadership to support deployment decision:

- How well IFTDSS met the WFI&T vision and strategy regarding an interconnected “system-of-systems” architecture
 - This also included recommendations for WFI&T updates to better support enterprise SOA-based systems such as IFTDSS
- How well IFTDSS met the business needs of improving the efficiency and quality of fuels treatment planning
- The potential for IFTDSS to improve software development and support processes for researcher-developed scientific models intended to be deployed for operational use
- The potential for IFTDSS to improve the fuels treatment planning training approach – in particular to enhance critical thinking and encourage end-to-end problem solving skills

SEI's Assessment Approach

General Approach For All Tasks

- Document review
- Interviews
- Demonstrations (as applicable)
- Research community and SEI body-of-knowledge (BOK)

Added For the IFTDSS Architecture Assessment

- Modified Architecture Tradeoff Analysis Method® (ATAM®)

Added For the Quality, Efficiency & Training Assessment(s)

- User workshops (extensive coordination and support from RD&A)
 - Pre-workshop webinars
 - Live workshops (*Portland, OR; Boise, ID; Sacramento, CA; Flagstaff, AZ; Rapid City, SD; Tallahassee, FL*)
 - Virtual workshops (*Alaska/Hawaii; Rocky Mountains; Lake States; Eastern US*)

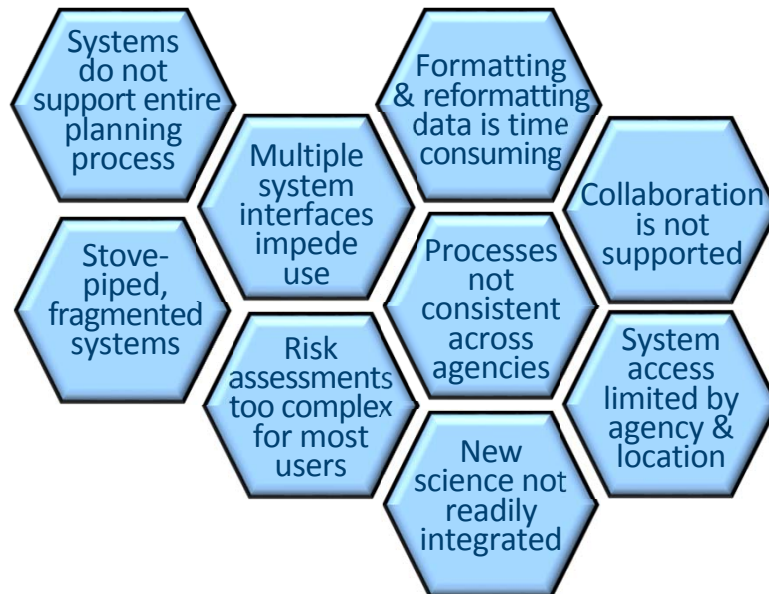

Assessment Findings

Interagency Fuels Treatment Decision Support System (IFTDSS)

Supports these strategic drivers

Addresses these user problems

FLAME Act

- "common analysis method...using common tools"
- risk assessments used to determine treatment areas

National Cohesive Wildland Fire Management Strategy

- "sound risk management is the foundation for all management activities"

Wildland Fire Information & Technology (WFI&T) Plan

- integrated, modular applications
- authoritative data
- available regardless of agency or location

Interagency Prescribed Fire Planning & Implementation Procedures Guide

- common planning workflow for all federal land management agencies

Assessment Findings

- Overwhelmingly, users rated IFTDSS as “very satisfactory” and “satisfactory” in all categories of assessment
- From an architectural perspective, IFTDSS is sound and responds well to the key architectural drivers
- Enables standardized, risk-based fuels management planning for large numbers of users
- Provides a rich set of tutorial material going beyond mechanics into a knowledge management system for corporate intellectual capital
- Demonstrates a framework that could support end-to-end training
- Allows for improving the management of fuels treatment thru its data management and its incorporation of scientific models
- Offers the opportunity to make significant improvements in the science of fuels treatment

What Supported Success?

The SOA-based technical approach was critical, but the real success factors other programs could adopt were non-technical:

- As the sponsor, JFSP was committed, informed, and involved
- JFSP “looked up” to meet (or anticipate) strategic goals
- JFSP “looked out” to conform to (or anticipate) IT governance
- JFSP “listened everywhere” by actively soliciting user, trainer, and researcher/developer input and regularly exposed the product for feedback as capabilities grew
- The program had achievable scope/schedule and a development approach that matched the contractor’s skill-set
- The government/contractor relationship was open and professional

Current Status – RD&A Management

INFORMATION BULLETIN – April 2015

IFTDSS

Interagency Fuels Treatment Decision Support System

iftdss.sonomatech.com

<https://www.frames.gov/partner-sites/iftdss/iftdss-home/>

Background: The Interagency Fuels Treatment Decision Support System (IFTDSS) is a web-based software and data integration framework that organizes previously existing fire and fuels software applications to make fuels treatment planning and analysis more efficient and effective. IFTDSS provides access to data and models, all in one place, through one user interface.

Current Status: *IFTDSS version 2.0.1 Beta* is currently available for use, testing and evaluation. IFTDSS will continue to be developed with input from Interagency partners and advisors over the next two years. It is expected that during 2017, the system will move from a Beta phase and will build upon the system integration efforts that started with the Joint Fire Science Program. Although development work is ongoing, users will find many features (listed below) that will enhance their fuels planning and operation efforts right now.

- ✓ *Prescribed Burn Planning with 2014 Interagency Standards*
- ✓ *Hazard Analysis using BEHAVE, FLAMMAP MTT and Flow paths,*
- ✓ *Risk Assessment using RANDIG and portions of Fire Family Plus*
- ✓ *Fire Effects Modeling with FOFEM, CONSUME, LANDFIRE (FCCS and FLM)*

Current Status

Future Project Enhancements:

- Access to fire behavior models found in WFDSS (Near Term, Short Term, FSPro)
- Access to data layers available in WFDSS
- Potential Integration with Fuels Treatment Effectiveness Monitoring (FTEM) Database
- Potential Integration with NFPORS
- Potential official archive for federal fuels treatment planning and analysis

Get Involved! All fire and resource management personnel are invited and encouraged to become an IFTDSS Beta user by requesting an account on the IFTDSS homepage at (<http://iftdss.sonomatech.com/>). Comments, suggestions, and any other input through the IFTDSS “Submit Feedback” link located on the homepage are encouraged and welcome.

Authors

John H. Cissel is the Program Manager of the Joint Fire Science Program, Boise, ID. Prior to that, John was the:

- Research Coordinator, Oregon BLM
- HJ Andrews Experimental Forest Director, Oregon State Univ
- Systems Analyst and Forest Planning Group Leader, Ochoco and Willamette National Forests

M. Steven Palmquist is a Principal Engineer in the Civil Sector of the SEI's Client Technical Solutions Directorate. Steve is a:

- Licensed Professional Engineer (Electrical)
- Project Management Professional (PMP®)
- PMI Agile Certified Practitioner (PMI-ACP®)

Prior to joining the SEI, Steve served as a helicopter pilot, engineer, and program manager in the U.S. Coast Guard
